obesity, or New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics

Claim 1; Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the

presence of authoria the above postpeptume of indicate and underecting a disease associated with altered levels of expression of the above colypoptide or nuclaic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiclogical interactions of the polypeptide; (11) a method of conseint physiclogical interactions of the polypeptide; (11) a method of conseint physiclogical interactions of the polypeptide; (11) a method of conseint physiclogy associated with the polypeptide; (12) a method of recating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a consense have antidiabetic, anotating the above polypeptide; Novx sequences have antidiabetic, anotating the above polypeptide in a mannant activities, anotating a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic cold molecule may be used to diagnose, treat or prevent metabolic cold sorders such as diabetes or obesity, infections, cachexia, cancer, cold molecule may be used to diagnose, treat or prevent metabolic cold sease, immune disorders, haematopoietic disorders and various cold sease, immune disorders, haematopoietic disorders and various cold pharmacogenomics. The present sequence represents a human NoVX from the present invarious. ô the above polypeptide or nucleic acid molecule in Gaps ö 100.0%; Score 40; DB 6; Length 252; ilarity 100.0%; Pred. Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease
                                          The enzyme encoded by this sequence is used in pharmaceutical, cosmetic and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkeratotic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psoriasis, eczema, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid pS507. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated human amyloid precursor protein protease - used to develop prods. for the treatment or diagnosis of associated conditions, esp.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide equaence comprising at least a significant part of a nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, or exiant in skin. The product of the invention is useful as a model or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a commette or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for sacreening or identifying a compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an endangment of prutitus, atopic dermatitis, eczema, acme and inherited skin diseases with epidermal hyperteatosis. The mammal of the invention skin diseases where itch is a component. This sequence represents the N-terminal compounds and compositions for relieve of various skin diseases constituted with human stratum chymotryptic enzyme. SCCE transgenic mammals described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                         SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; serine protease; transgenic mammal, skin; skin disease; skin cancer; hyperkeratosis; acanthosis; epidermal inflammation; dermal inflammation; prunitus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 40; DB 5; Length 253, Pred. This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCEB) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving tracument, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a kin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or compound or composition effective for the prevention or treatment of compound or composition effective for the prevention or treatment of an abnormal or composition effective for the prevention or treatment of an abnormal or composition effective for the prevention or treatment of an abnormal or compound or compound or composition effective for the prevention or treatment of an abnormal or compound or composition effective for the prevention or treatment of an abnormal or composition effective for the prevention or treatment of an abnormal or composition effective for the prevention or treatment of an approach of the content of the content of the composition effective for the prevention or treatment of an approach of the content inflammatory skin diseases selected from diseases consisting of epidermal hyperkeratosis, acanthosis, epidermal inflammation, dermal inflammation, prurtus, atopic dermatitis, eczema, acne and inherited skin diseases with mepidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential components and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine protease synonymous with human kallikrein 7 (KLK7) and is used in the development of the transgenic mammals described in the invention Claim 10; Page 58-59; 74pp; English.

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. inflammatory diseases), brain or neuronal associated diseases, metabolic coronary thrombosis), brain or neuronal associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory diseases (e.g. diseases, migraines, pain, sexual dysfunction, mood disorders, attention disorders, pain, sexual dysfunction, hypertension, psychotic disorders, neurological disorders, hypotension, hypertension, psychotic disorders, neurological disorders (e.g. Alzheimer's disease, Parkinson's cuseful for treating viral infections caused by human immunodeficiancy viral infections such as ocular disease (e.g. clausement) and macular degeneration. AAU82702-AAU82760 represent the novel

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer. In a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves contentially regulated in prostate cancer. For expression levels in a sample comprising prostate tissue of target genes which are differentially regulated in prostate cancer. Preferentially regulated in prostate cancer. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contenting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulates the biological activity. (I) is useful as molecular markers, as first targets, and for detecting, diagnosing, staging, grading, assessing, monitoring, prognosticating, grading, prading, monitoring, prognosticating, conditions especially relating to prostate cancer. (I) and its expression conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer. Conditions especially relating to prostate cancer. (I) and its stage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can also be used for expressing the polypeptide and thus for searching specific binding partners of the polypeptide and thus in therapeutic applications to treat prostate cancer. The identification in therapeutic applications to treat prostate cancer. The identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue determining the expression levels of at least 10 genes are determined. Freferably, the expression levels of at least 10 genes are determined. (I) is also useful for identifying agents that modulate a biological cutivity of a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the prostate cancer calls with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful as molecular markers, as drug targets, and for detecting,
                                                                                                                                                                                                                  ;

diagnosing, staging, grading, assessing, monitoring, prognosticating, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (1) and its expression products are used in the diagnostic test to assay for presence of cancer. (2) blood etc. (1) is useful for assessing cancer e.g., to determine the type of cancer, its stage of development, the nature of genetic defect, etc. (2) cancery. (1) can also be used for stress of for therapy or drug discovery. (1) can also be used for stressing the polypeptide and thus (2) con searching specific binding partners of the polypeptide. (1) is useful to the paper of the polypeptide on thus (2) in therapeutic applications to treat prostate cancer. The identification of physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein differentially regulated in prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human stratum corneum chymotryptic enzyme - ovarian cancer clone 01676P.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytostatic; gene therapy; vaccine; cancer; ovarian cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
```

The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynuclectide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polynucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
in diagnosing ovarian cancer and in identifying and using agents and/or
targets that inhibit ovarian ancer. The nucleic acid molecule,
polypeptide and the antibody may also be used in detecting ovarian
cancers, monitoring and early detection of relapse following treatment,
monitoring response to therapy, in selecting patients for post-operative
chemotherapy or radiation therapy, in selecting mode of therapy,
and as vaccines. This sequence corresponds to one of the proteins used
for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Sequence 110, Application US/09905083

Patent No. US20020146708A1

GENERAL INFORMATION:

APPLICANT: O'Erien, Timochy J.

TITLE OF INVENTION: Compositions and Methods for the Early Diagnosis of TITLE OF INVENTION: O'Aratan Cancer

FILE REPERRANCE: D6223CIP/C/Dia

CURRENT APPLICATION NUMBER: US/09/905,083

CURRENT APPLICATION NUMBER: US/09/905,083

PRIOR FILING DATE: 2001-07-13

PRIOR FILING DATE: 2001-07-13

PRIOR FILING DATE: 2000-02-11

NUMBER OF SEQ ID NOS: 136

LENGTH: 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 110, Application US/09918243

Patent No. US20020142317A1

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

A,Title: ERC-55, a binding protein for the papilloma virus E6 oncoprotein, specifically 3
A,Reference number: JC5402, MUID:97312489; PMID:9168930
A,Recession: JC5602,
tajoxin-associated calciuum binding protein-49 precursor - rat
C;Species: Rattus norvegicus (Norway rat)
C;Date: 26-Jul-1996 #sequence_revision 26-Jul-1996 #text_change 02-Aug-2002
C;Accession: 156519
R;Dodds, D.; Schlimgen, A.K.; Lu, S.Y.; Perin, M.S.
J. Neurochem. 64, 233-2444, 1995
A;Title: Novel reticular calcium binding protein is purified on taipoxin columns.
A;Reference number: 156519; MUID:95239201; PMID:7722520

       cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-
|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation
of precursors to inflammatory cytokines.
-!- TISSUE SPECIFICITY: Abundantly expressed in the skin and is
expressed by keratinocytes in the epidermis. Very low levels are
also seen in the brain and kidney.
-!- SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Proc. Natl. Acad. Sci. U.S.A. 99:14434-14439 (2002).

-!- FUNCTION: Bidirectionally degrades single-stranded DNA into large acid-insoluble oligonucleotides, which are then degraded further into small acid-soluble oligonucleotides (By similarity).

-!- CATALYTIC ACTIVITY: Exonucleolytic cleavage in either 5'- to 3'- or 3'- to 5'-direction to yield nucleoside 5'-phosphates.

-:- SUBUNIT: Heterooligomer composed of large and small subunits (By similarity).

Insect Blochem. Mol. Biol. 30:609-609 (2000).

-!- FUNCTION: Degradation of external UDP-qlucose to uridine monophosphate and glucose-1-phosphate, which can then be used by the cell (By similarity).

-!- CATALYTIC ACTIVITY: UDP-sugar + H(2)O = UMP + sugar 1-phosphate.
-!- CATALYTIC ACTIVITY: A 5'-ribonuclectide + H(2)O = a ribonucleoside
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

X Locystal structure of the DNA-binding domain of Mppl, a transcription of actor important in cell-cycle control of DNA synthesis.";

XT Crystal structure of the DNA-binding domain of Mppl, a transcription of actor important in cell-cycle control of DNA synthesis genes. Transcriptional in the promoter of most DNA synthesis genes. Transcriptional the promoter of most DNA synthesis genes. Transcriptional the promoter of most DNA synthesis genes. Transcriptional from G1 activation by MBP has an important role in that it behaves as an activator of transcription at the G1-S boundary and as a repressor during other stages of the cell cycle.

C during other stages of the cell cycle.

C --- SUBCELIULAR LOCATION: Nuclear.

-!- FUNCTION: Unusual circulary permuted GTPase that catalyzes rapid
-!- Apdrolysis of GTP with a slow catalytic turnover (By similarity).
-!- SUBUNIT: Monomer (Probable).
-!- SIMILARITY: Contains 1 engC GTPase domain.
                                                                                                                                                                                              Gaps

```
The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCED). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCED oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide
                                                                                                                    Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.
                                                                                       Human stratum corneum chymotrypsin enzyme peptide #3 (residues 5-13).
                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing cancer comprises detecting stratum corneum chymotrypsin

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal ectivity of (II) as useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and its binding pattners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in disprostice forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at

WO2003029424-A2.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above; (3) an isolated nucleic acid described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector contrainsing the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (6) a cell comprising the bove vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a cample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a cample; (8) methods for identifying a pertoning the presence of or predisposition to a physpetide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying a pertoning to the polypeptide described above; (10) a method for identifying a pethology that is related to an aberrant expression or use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or creating a pathology associated with the above polypeptide; NOVX sequences have antidiabetic, anorectic, antibacterial, virucide, in a method activities, and can be used in gene therapy. The companient activities, and can be used in gene therapy. The companient activities, and can be used in gene therapy. The companient activities, and can be used in gene therapy. The companient aborders such as Alzheimer's disease or Parkinson's disease, immune disorders under and sone acid molecule may be used to dispore, treat or prevent metabolic acid molecules. The pulpapetide is useful in manufacturing a medicament of polypeptide and acid molecule may be used to disporders and encodernative disorders New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics. probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the Claim 1; Page 170; 586pp; English. present invention.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 169-170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOVI). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit composition in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a cell 1

comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
comprising or nucleic acid molecule in a first mammalian subject; (9) a
method of identifying an add molecule in a first mammalian subject; (9) a
method of identifying an add molecule in the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
the above above; (10) a method for identifying a potential therapeutic agent for
cuse in treating a pathology that is related to an aberrant expression of
aberrant physiological inceractions of the polypeptide; (11) a method of
aborator physiological inceractions of the polypeptide; (11) a method of
acreening for a modulator of activity or of latency or predisposition to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid oppitde. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. col1) or eukaryotic and testing of cpds. useful for treating or breventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              to develop

Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

Example 6; Page 37; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a tractum corneum chymotryptic enzyme (SCCE) or its variant, coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, coperably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve commetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an annowable or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an inflammation, pruritus, acopic dermatitis, eczemal inflammation, dermal inflammation, pruritus, atopic dermatitis, eczemal, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention salso useful sa a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases synonymous with human stratum corneum chancer represents the N-terminal synonymous with human stratum corneum chancer program chancer of the human stratum corneum chancer in the development of the invention or the engagement of th

Egelrud T, Hansson L;

WPI; 2002-643380/69. N-PSDB; ABQ76226 Transgenic mammal or its embryo useful as model for human disease, has beterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

Claim 10; Page 58-59; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence conjugate least a significant part of a nucleotide sequence coding for a treatum corneum chymotryptic enzyme (SCCE) or its variant, coffic and the product of the invention is useful as an endel for its variant, in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmacutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal phenotype, and for screening or inflammation, privitus, atopic dermatisis, eczema, acme and inherited skin diseases with phenotype and compositions for the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases which man wallikrein 7 (KLK) and is a serine procease synonymous content and the invention is the human stratum conneur. Thus a component. This sequence represents the human stratum conneur. transgenic mammals described in the invention

Novel genes which are differentially regulated in prostate cancer, usef for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 293-294; 416pp; English.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves contention for target genes which are differentially regulated in prostate cancer.

C to target genes which are differentially regulated in prostate cancer.

C target genes which are differentially regulated in prostate cancer.

C to is also useful for identifying agents that modulate a biological activity of a polypeptide differentially regulated in prostate cancer cells, which involves contenting a polypeptide differentially regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, contentions especially regulated in the diagnostic not diseases and conditions especially relating predisposition to diseases and conditions are used in the diagnostic prest, in total RNA, in lymph, in the polypetide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide encoded by (I) can be used as target for therapy or drug concerned by specific binding partners of the polypeptide encoded by (I) can be used as target for therapy or drug concerned by specific opings of genes expressing the polypeptide encoded by (I) can be used to rear prostate cancer. The identification of the repression of the polypeptide encoded by (I) can be used to rear prostate cancer. The polypeptide encoded by (I) can be used to rear expect in therapeut and disease pat

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate cancer. Of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (I) is also useful for identifying agents that modulate a biological collis, which involves contacting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to medulate a biological activity. (I) as useful as molecular markers, as drug targets, and for detecting, cancering or treating, determining to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer. (I) is useful for assessing cancer eg., to determine type of conducts are used in the diagnostic test to assay for presence of cancer. (I) is useful for assessing cancer eg., to determine type of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynuclectides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
for searching specific binding partners of the polypeptide. (I) is useful in therapeutic applications to treat prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways not physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these applications. This is the amino acid sequence of a protein differentially regulated in prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine.

The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a balological sample from the patient with a polymolectide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 mucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancer, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, electing determining tumour prognosis, early detection of pre-cancerous lesions, and as vaccines. This sequence corresponds to one of the proteins used for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence is human stratum corneum chymotryptic enzyne (HSCEE), a member of the kallikrein multi-gene family. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KKL-Li, AKK-Li, AMK-Li, AM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonuclectide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide .; 0 Query Match 90.0%; Score 36; DB 4; Length 9; Best Local Similarity 100.0%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 31, Application US/09918243

Sequence 31, Application US/09918243

Patent No. 6627403

GENERAL INFORMATION:

APPLICANT: O'Brien, Timothy J.

APPLICANT: Cannot, Martin J.

APPLICANT: Cannot, Martin J.

APPLICANT: Santin, Alessandro

TITLE OF INVENTION: Methods for the early diagnosis of ovarian cancer;

FILE REPERENCE: D6223GIP/C/D/CIP

CURRENT APPLICATION NUMBER: US/09/918,243

CURRENT APPLICATION NUMBER: US

PRIOR APPLICATION NUMBER: US

PRIOR PLING DATE: 2001-07-13

NUMBER OF SEQ ID NOS: 136

SEQ ID NO 31
